

ABSTRACT

1 A method for video indexing using high resolution still images enables a user to
2 acquire high resolution still images during a video sequence recording so that the user can
3 selectively view the video sequence using the high resolution still images as video
4 indices. The still images typically have higher resolution than the video sequence. By
5 selecting the high resolution still images to capture memorable moments, the user is able
6 to view the video sequence around the instances of the still images within the video
7 sequence.
